namely: 1) the frequency-dependent resistive loss; 2) the self-resonance of the inductor; and 3) the substrate-related losses. The frequency-dependent resistive loss is mainly due to the skin resistance, which can be reduced by thick metallization. An-other dominant loss mechanism related to resistive loss is current crowding [14], [15].

For the uncompensated VCO, the frequency range at -2 bip U is 2.366GHz to 2.602GHz and at +2 bip a is 2.550GHz to 2.834GHz. There is an overlapping Frequency range of $(2.602-2.550) = 48\text{MHz}$. Thus, if the bipolar process is controlled between eulimits, the VCO guarantees 48MHz of tuning range at centre frequency of 2.576GHz.
